AEB Project Manager: Patrick D. Gsellman, PE
AEB Environmental Division

EXECUTIVE SUMMARY

Introduction

The City of Akron is submitting the following Final Long Term Control Plan Update Report as required by Attachment A, Section II.B of the Consent Decree lodged in the United States District Court for the Northeastern District of Ohio, Eastern Division on November 13, 2009. The Consent Decree requires that the City implement CSO controls that will be constructed and achieve full operation no later than October 15, 2028.

This Long Term Control Plan Report is the culmination of decades of proactive efforts put forth by the City in order to reduce combined sewer overflows to local receiving streams. Since 1993 the City of Akron has completed numerous projects totaling in excess of \$70 million dollars to help improve water quality within the Cuyahoga River, Little Cuyahoga River, Ohio Canal, and Camp Brook. This Long Term Control Plan Report demonstrates the City's continuing commitment to being a leader in environmental stewardship.

Plan Organization

The Final Long Term Control Plan (LTCP) Update Report is organized in accordance with the United States Environmental Protection Agency's *Combined Sewer Overflows Guidance for Long Term Control Plan*. The City's LTCP contains the following sections:

- Section 1: Background
- Section 2: Characterization, Monitoring, and Modeling
- Section 3: Public Participation
- Section 4: Consideration of Sensitive Areas
- Section 5: Maximization of Treatment at Water Pollution Control Station
- Section 6: Evaluation of Alternatives
- Section 7: Cost Performance Considerations
- Section 8: Recommended Plan
- Section 9: Implementation Schedule
- Section 10: Operational Plan
- Section 11: Post Construction Monitoring Program
- Section 12: Bibliography
- Appendices

Section 9 (Implementation Schedule) contains the Long Term Control Plan Update required by the Consent Decree in Attachment A, Section II.A. Section 11 of this LTCP contains information on post construction monitoring required by Attachment B of the Consent Decree.

Recommended Plan

The City's selected CSO Long Term Control Plan will be the largest wastewater system capital program ever undertaken by the City in its long history. Once completed, the plan will deliver substantial environmental benefits to local waterways. However, this plan will also place an extremely high economic burden on local ratepayers.

Several related, yet sometimes very diverse factors influence the selection of a recommended Long Term Control Plan. When considered individually, these factors might suggest selection of different LTCPs. The City of Akron's approach to selecting its final recommended plan recognizes that these factors must be considered collectively in order to select the best overall plan. By doing so, the selected LTCP, per the intent of the CSO policy, will provide the best balance of measures that help improve the environmental conditions in local receiving streams, reduce existing combined sewer overflows, address regulatory requirements, and ensure that the economic impact to ratepayers is reasonable and affordable, while completing the plan within the remaining 17 years of the timeline set forth in the Consent Decree.

The City's recommended plan consists of the major elements shown in Table ES-1.

Table ES-1 Recommended Plan Major Elements

PROJECT TYPE	LEVEL OF CONTROL	ESTIMATED PROJECT COST (in 2010 dollars)
LTCP PROJECTS		
Storage Basins	3 overflows/year	\$55,100,000
Ohio Canal Interceptor Tunnel	3 overflows/year	\$183,900,000
North Side Interceptor Tunnel	3 overflows/year	\$153,800,000
Sewer Separation Projects		\$27,400,000
Total LTCP Projects		\$420,200,000
CONSENT DECREE PROJECTS		
WPCS Improvements	Step Feed Process	\$65,000,000
Mud Run Pump Station		\$20,000,000
CMOM	\$2M/year	\$34,000,000

Table ES-1 Recommended Plan Major Elements (Continued)

PROJECT TYPE	LEVEL OF CONTROL	ESTIMATED PROJECT COST (in 2010 dollars)
CONSENT DECREE PROJECTS (Continued)		
Post Construction Monitoring		\$2,000,000
Total Consent Decree Projects		\$121,000,000
NON-CONSENT DECREE PROJECTS		
Existing System Reinvestment	\$2M/year	\$34,000,000
Disinfection Improvements		\$7,000,000
Total Non-CD Projects		\$41,000,000
TOTAL CLEAN WATER PROGRAM		\$582,200,000

In many other CSO communities around the country, sewer rates representing 2% of median household income (MHI) for residential customers are considered to place a high burden on ratepayers. The recommended plan that Akron is proposing will push our ratepayers to the 2% threshold in very short order (by 2014), as shown in Figure ES-1. At the conclusion of the 17 year implementation period, Akron Retail Service Area customer's monthly sewer bills will represent close to 2.4% of their median household income. This equates to a typical Akron residential customer paying approximately \$120 per month for sewer service in 2028 after the CSO projects are constructed.

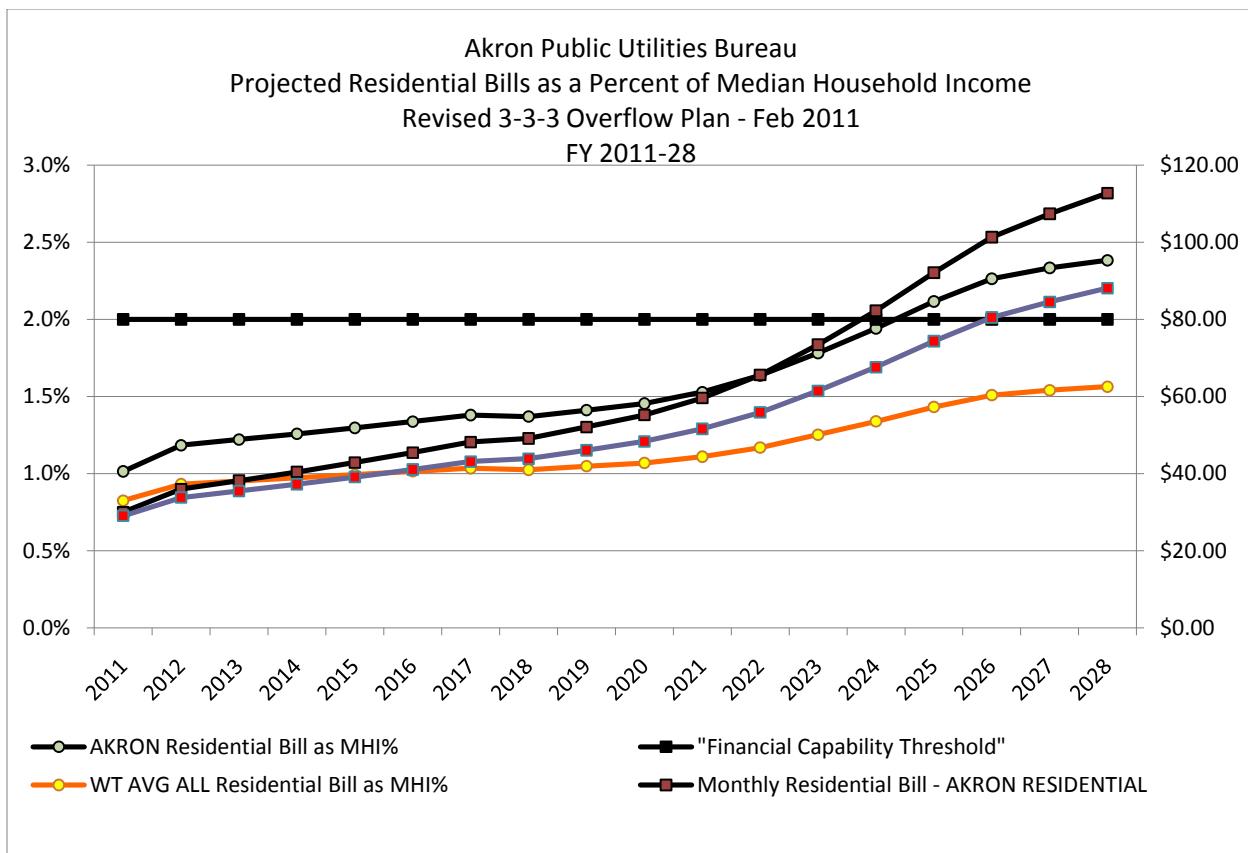

Figure ES-1 Projected Residential Sewer Bills as a Percent of Median Household Income Benefits of Recommended Long Term Control Plan

Implementing the City's recommended LTCP will produce several benefits within local receiving streams. Figure ES-2 shows that the City's plan, along with the previously completed Rack 40/Cuyahoga Street Storage Facility, will reduce overflow volume by approximately 77% in a typical year as compared to current conditions. Figure ES-3 illustrates that approximately 13 additional hours of compliance with Ohio's E. coli water quality standard will result from the recommended plan. Figure ES-4 shows that when comparing CSO only contributions to water quality, the City's recommended plan will have a significant benefit to local receiving water quality.

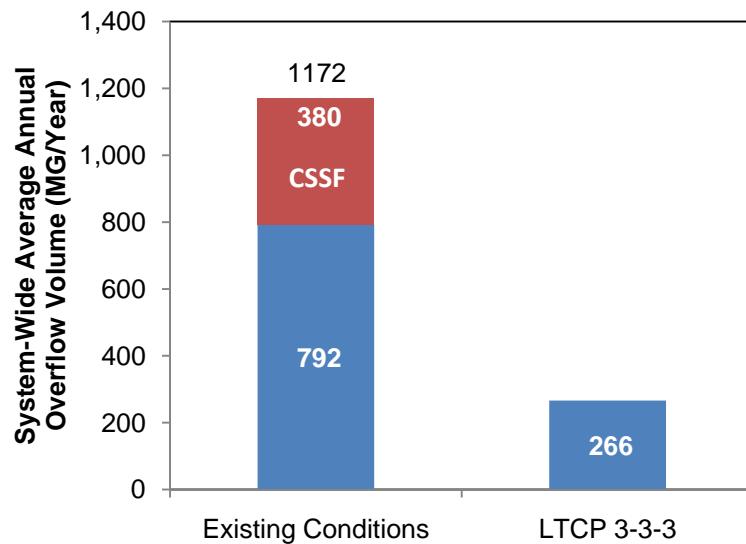

Figure ES-2 Typical Year Estimated Overflow Volume for 3-3-3 Plan

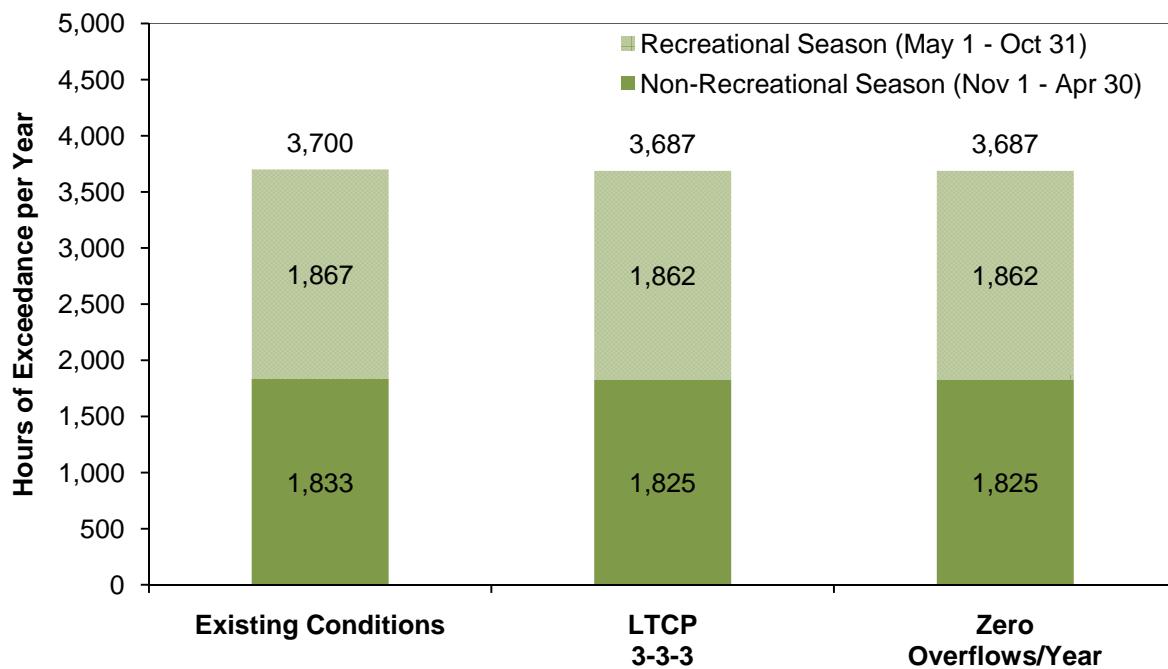

Figure ES-3 Estimated E. coli Hours of Exceedance per Year

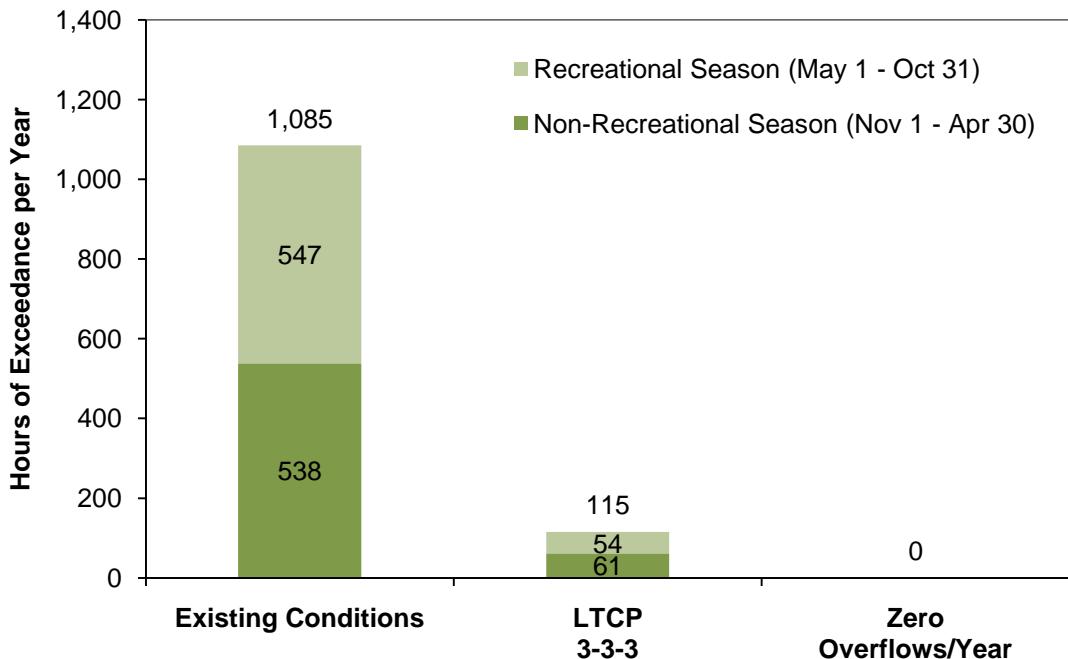

Figure ES-4 Estimated E. coli Hours of Exceedance per Year – CSOs Only

Alternative Proposed Recommended Plan

The City's recommended plan reduces overflow occurrences within the combined sewer system to approximately 3 times in a typical year. As demonstrated above, the City cannot go to a higher level of control (less overflow occurrences) within the 19 year time frame prescribed by the Consent Decree while still keeping rates affordable. However, as an alternative proposal, the City is willing to implement projects that achieve a higher level of CSO control so long as the City has an adequate amount of time to implement these projects. As part of the financing plan for these projects the City will commit to a rate structure that keeps rates at or near 2.1% MHI for as long as it takes to implement the controls. USEPA and Ohio EPA can select the level of control and the order of the projects so long as there is a demonstrated cost benefit and water quality benefit. See Section 8 for a more detailed explanation of the alternative plan.

Akron CSO LTCP Update Report

Table 1: LTCP Update Report (Consent Decree Requirements, Attachment A, Section I)

Consent Decree Location	Consent Decree Requirements	LTCP Update Section
I.A & I.B	Results of updated NFA (submitted by November 30, 2009).	5
I.D.1(a)	Results of assessing cost and effectiveness of Ohio Canal Tunnel both with and without treatment for eliminating or reducing and/or treating CSOs (Racks 4, 16-20, 23, 24, and 37).	7
I.D.1(b)	Results of assessing cost and effectiveness of Northside Tunnel both with and without treatment for eliminating or reducing and/or treating CSOs (Racks 32-35, and 40).	7
I.D.2	Results of assessing cost and effectiveness of constructing storage basins for eliminating or reducing CSOs from Racks 3, 5/7, 10/11, 12, 14, 15, 22, 26/28, 27/29, and 36.	7
I.D.4(a)	Results of evaluating a range of sizes of each alternative that will reduce the number of untreated CSOs down to a range of numbers of overflows per year per CSO outfall.	7
I.D.4(b)	Results of the evaluation of the project costs for each control measure that is evaluated as capital, O&M, and total present worth.	7
I.E	Results of alternative sizes, associated costs, and benefits for each CSO outfall/rack that results in a minimum of 0-4 overflows (submitted by May 15, 2010).	7
I.F.1	Results of cost benefit interim submission, preliminary report on modeling to predict sizes and number of overflows for OCI Tunnel Facilities, NSI Tunnel Facilities, and Remote Storage Facilities (submitted by January 15, 2010).	7
I.F.2	Results of cost benefit interim submissions, preliminary report on cost-benefit comparison to predict sizes and number of overflows for Requested Facilities (submitted by March 15, 2010).	7
I.G	Results of Financial Capability Information (submitted by May 15, 2010).	8

Akron CSO LTCP Update Report

Table 2: LTCP Update Report (Consent Decree Requirements, Attachment A, Section II)

Consent Decree Location	Consent Decree Requirements	LTCP Update Section
II.B.1	Provide results of all analyses, evaluations, and assessments performed under Section I of the Work Plan.	See Table 1
II.B.1(a)	Evaluation of Alternatives (costs, benefits, effectiveness) for eliminating or reducing and/or treating CSOs and secondary treatment bypasses, including a discussion of why Akron selected the design and performance criteria presented in the Proposed LTCP Update.	6, 9
II.B.1(b)	Explanation of why CSO control measures comply with CSO Control Policy, CWA requirements, R.C. Chapter 6111, and the Current NPDES Permit.	8
II.B.1(c)	If not achieving zero-bypass of secondary treatment, an explanation of why it is not feasible either technically or financially.	5
II.B.1(d)	Description of why the implementation schedule realizes Full Operation of all Control Measures as expeditiously as possible.	8
II.B.1(e)(i)	Analysis of the impact each control measure will have on peak instantaneous and sustained flows to the WPCS during the 1994 adjusted typical rainfall year.	6
II.B.1(e)(ii)	Analysis of the impact that an increase in the capacity of the WPCS may have on the overflow events and alternatives in the system.	6
II.B.1(f)	Proposed Financial Capability Assessment.	8

FINAL CSO LONG TERM CONTROL PLAN UPDATE REPORT

1. BACKGROUND

This section provides background information on the purpose, scope, and organization of the Final Long Term Control Plan (LTCP) Update Report, existing sewer collection system, City of Akron land use data and demographics, regulatory framework, and history of Combined Sewer Overflow (CSO) compliant projects.

1.1 Report Purpose, Scope, and Organization

The CSO Final LTCP Update Report has been developed by the City of Akron (City) to comply with the Consent Decree that was lodged with the U.S. District Court in November 2009, the current National Pollutant Discharge Elimination System (NPDES) permit, and the CSO Control Policy. This Final LTCP Update Report contains a comprehensive CSO control plan that recognizes the site-specific nature of CSOs and their impacts on receiving water bodies, along with CSO control measures that are cost effective, feasible, and consistent with the USEPA CSO Control Policy. The document addresses the nine elements of the LTCP, states a recommended plan, and is organized as follows:

- Background (Section 1)
- Characterization, Monitoring, and Modeling (Section 2)
- Public Participation (Section 3)
- Consideration of Sensitive Areas (Section 4)
- Maximization of Treatment at WPCS (Section 5)
- Evaluation of Alternatives (Section 6)
- Cost Performance Considerations (Section 7)
- Recommended Plan (Section 8)
- Implementation Schedule and Long Term Control Plan Update (Section 9)
- Operational Plan (Section 10)

- Post-Construction Monitoring Program (Section 11)
- Bibliography (Section 12)

This CSO Final LTCP Update Report shall serve as the basis for future CSO control projects, including projects at the Akron Water Pollution Control Station (WPCS).

1.2 Planning Area

The City of Akron's existing sewer system contains storm, sanitary, and combined sewers. These sewers are located within the planning area, consisting of approximately 183 square miles and servicing over 356,000 people as shown in Figure 1-1.

1.2.1 The Existing Sewer System

The City has been continuously updating their sewer system to meet the demands of their consumers as well as local, state, and federal requirements and standards. The following subsections describe the location, components, maintenance, general background of the WPCS, and history of the sewer system.

General Location

The majority of the existing sewer system is located within the Akron Metropolitan Area in Summit County. The Akron Metropolitan Area consists of the City of Akron, City of Cuyahoga Falls, City of Fairlawn, City of Munroe Falls, Village of Lakemore, Village of Mogadore, Village of Silver Lake, and parts of the City of Stow, City of Tallmadge, Bath Township, Copley Township, Coventry Township, and Springfield Township.

Sewer System Components

The sewer collection system consists of approximately 490 miles of storm sewer, 700 miles of sanitary sewer, and 170 miles of combined sewer pipes, totaling approximately 1,360 miles. The system contains approximately 28,600 manholes and 37 pump stations. Dry weather flow in the sanitary and combined sewer systems is conveyed to the WPCS, located in Akron at 2460 Peninsula Road. A map of the sanitary and combined sewer systems is shown in Figure 1-2. Storm sewers convey storm water to points of discharge to nearby streams. In the existing sanitary sewer system there are defined Combined Sewer Overflows (CSOs). CSO is the discharge from a combined sewer system at a point prior to the POTW. There is also an overflow from the Mud Run
